PROGRESS REPORT

What went well last week?

Studying the structure of the ASP .NET and establishing database.

What is the focus of today?

Making the controllers for testing without heavy logic.

What blockers exist?

Having illness that does not fade away in how many weeks and some projects that are not heavy to the point that we are making an events and such even if its minor.

What went well?

Making the backend without much issue as I studied the the .NET framework's structure, though it took week

What didn't go well?

The unknown and unexpected errors that appear if its time to pass the project or when the other lappy lack something that occurs an error.

What should we start doing?

Informing the Frontend and the Project Manager of the data that will pass to something or just explaining the process of everything they ask so that they could visualize and understand the limits in making the project.

What should we stop doing?

Not making a time management, when to rest, when to work. This is very essential in our time as there are other courses that we need to handle along with this course (which is what I think is the most important)

What should we continue doing?

Continue studying not only the problem but the structure for more smooth and fun experience making the project.
